**ABSTRACT**

This paper deals with modification of Milton’s estimator of population variance using coefficient of quartile deviation and unknown weight of auxiliary variable. The Bias and Mean Square Error (MSE) of proposed estimator are obtained up to the first order of approximation by Taylor’s Series Method. The expression for the unknown weight is obtained and an empirical study was conducted to assess the performance of proposed estimator over some selected existing estimators. A numerical study is carried out to assess the efficiency of proposed estimator over the existing estimator with the aid of some known natural populations. Numerical study results shown that the proposed estimator performs better than the existing estimators.

**Keywords:**
unknown-weight, coefficient of kurtosis, median, auxiliary variable, median, mean square error

1. Introduction

The use of auxiliary information, being constant with unit (population variance, population mean, population standard deviation, etc.) or unit free constant (Coefficients of variation, Kurtosis, Skewness etc.), can enhance the efficiency at the estimation stage. [1, 2,3], and [4] utilized this concept to improve the efficiency of ratio and product type estimators for estimating the population variance as well as population mean of study variable. To effectively estimate the population parameter of the variable of interest, there is need for the population values of the auxiliary variables. When auxiliary information is available researchers are able to utilize it in methods of estimation to obtain the most efficient estimator [5]. In many situations, information on the auxiliary is required either at the designing stage or estimation stage or both stages, to increase precision of the estimators. Ratio, Product and regression estimators are often used when advance knowledge of population variance of the auxiliary variable is readily available. In a class of estimators, an estimator with minimum variance or mean square error is regarded as the most efficient estimator. Estimation of the population variance of the study variable \( Y \) has received a considerable attention from experts engaged in survey statistics. For example, in agriculture the variation in production of crop is required for further planning or in manufacturing industries and pharmaceutical laboratories, the variation life of their products is a necessity for their quality control. Although, in literature, a great variety of techniques have been used mentioning the use of auxiliary information by means of ratio, product and regression methods for estimating population variance and other parameters [6].

Let \( \Omega = (1, 2, 3, ..., N) \) be a population of size \( N \) and \( Y, X \) be two real valued functions having values \( (Y_i, X_i) \in \mathbb{R}^+ > 0 \) on the \( i^{th} \) unit of \( U(1 \leq i \leq N) \). Let \( S_y^2 \) and \( S_x^2 \) be the finite population
variance of $Y$ and $X$ respectively and $s^2_y$ and $s^2_x$ be respective sample variances based on the random sample of size $n$ drawn without replacement.

$$\bar{X} = \frac{1}{N} \sum_{i=1}^{N} X_i, \quad \bar{Y} = \frac{1}{N} \sum_{i=1}^{N} Y_i, \quad \bar{x} = \frac{1}{n} \sum_{i=1}^{n} x_i, \quad \bar{y} = \frac{1}{n} \sum_{i=1}^{n} y_i, \quad f = \frac{n}{N}, \quad s^2_y = \frac{1}{n-1} \sum_{i=1}^{n} (y_i - \bar{y})^2,$$

$$s^2_x = \frac{1}{n-1} \sum_{i=1}^{n} (x_i - \bar{x})^2, \quad S^2_y = \frac{1}{N-1} \sum_{i=1}^{N} (Y_i - \bar{Y})^2, \quad S^2_x = \frac{1}{N-1} \sum_{i=1}^{N} (X_i - \bar{X})^2.$$

The sample variance estimator of the finite population variance is defined as

$$t_1 = S^2_y$$

which is an unbiased estimator of finite population variance $S^2_y$ and its variance is

$$Var(t) = \frac{1-\bar{f}}{n} S^4_y (\lambda_{40} - 1)$$

[7] proposed a ratio type variance estimator for the finite population variance $S^2_y$ when the finite population variance $S^2_x$ of auxiliary variable $X$ is known. The bias and its mean squared error are given below:

$$t_2 = s^2_y \frac{s^2_x}{s^2_y}$$

$$Bias(t_2) = \frac{1-\bar{f}}{n} S^4_y \left[ (\lambda_{44} - 1) - (\lambda_{42} - 1) \right]$$

$$MSE(t_2) = \frac{1-\bar{f}}{n} S^4_y \left[ (\lambda_{44} - 1) + (\lambda_{44} - 1) - 2(\lambda_{42} - 1) \right]$$

[8] proposed a ratio estimator for finite population variance by imposing Coefficient of kurtosis on the work of [4] as:

$$t_3 = S^2_y \left( \frac{S^2_x + \beta(x)}{S^2_x + \beta(x)} \right)$$

$$Bias(t_3) = \frac{1-\bar{f}}{n} A_3 S^2_y [A_3 (\lambda_{44} - 1) - (\lambda_{42} - 1)]$$

$$MSE(t_3) = \frac{1-\bar{f}}{n} S^4_y \left[ (\lambda_{44} - 1) + A_3 (\lambda_{44} - 1) - 2A_3 (\lambda_{42} - 1) \right]$$

Where $A_3 = \frac{S^2_x}{S^2_x + \beta(x)}$

[9] proposed a class of ratio type estimators for finite population variance by imposing Coefficient of variation and Coefficient of kurtosis on the work of [7] as:

$$t_4 = S^2_y \left( \frac{S^2_x - C_x}{S^2_x - C_x} \right)$$

$$t_5 = S^2_y \left( \frac{S^2_x - \beta(x)}{S^2_x - \beta(x)} \right)$$

$$t_6 = S^2_y \left( \frac{S^2_x \beta(x) - C_x}{S^2_x \beta(x) - C_x} \right)$$

82
\[t_i = s_y^2 \left( \frac{S_y^2 C_x - \beta_{x(2)}}{S_y^2 C_x - \beta_{y(2)}} \right)\]  

(12) \]

\[\text{Bias}\left(t_i\right) = \frac{1-f}{n} A_i S_y^2 \left[ A_i \left( \lambda_{04} - 1 \right) - \left( \lambda_{22} - 1 \right) \right], \quad \text{where } i = 4, 5, 6, 7 \]

(13) \]

\[\text{MSE}\left(t_i\right) = \frac{1-f}{n} S_y^4 \left[ \left( \lambda_{40} - 1 \right) + A_i^2 \left( \lambda_{04} - 1 \right) - 2 A_i \left( \lambda_{22} - 1 \right) \right], \quad \text{where } i = 4, 5, 6, 7 \]

(14) \]

Where \( A_4 = \frac{S^2}{S^2 - C_x}, \quad A_5 = \frac{S^2_x}{S^2_x - \beta_{2(x)}}, \quad A_6 = \frac{S^2_x \beta_{2(x)}}{S^2_x \beta_{2(x)} - C_x}, \quad A_7 = \frac{S^2_{C_x}}{S^2_{C_x} - \beta_{2(x)}} \)

[10] proposed ratio type estimators for finite population variance using quartiles and median of auxiliary variable as:

\[t_i = s_y^2 \left( \frac{S_x^2 + M_d}{S_y^2 + M_d} \right)\]  

(15) \]

\[t_i = s_y^2 \left( \frac{S_x^2 + Q_x}{S_y^2 + Q_x} \right)\]  

(16) \]

\[t_{10} = s_y^2 \left( \frac{S_x^2 + Q_3}{S_y^2 + Q_3} \right)\]  

(17) \]

\[\text{Bias}\left(t_i\right) = \frac{1-f}{n} S_y^2 A_i \left[ A_i \left( \lambda_{04} - 1 \right) - \left( \lambda_{22} - 1 \right) \right] \quad \text{where } i = 8, 9, 10 \]

(18) \]

\[\text{MSE}\left(t_i\right) = \frac{1-f}{n} S_y^4 \left[ \left( \lambda_{40} - 1 \right) + A_i^2 \left( \lambda_{04} - 1 \right) - 2 A_i \left( \lambda_{22} - 1 \right) \right] \]

(19) \]

\[A_8 = \frac{S^2}{S^2 + M_d}, \quad A_9 = \frac{S^2_x}{S^2_x + Q_x}, \quad A_{10} = \frac{S^2_x}{S^2_x + Q_3} \quad \text{where } i = 8, 9, 10 \]

\[t_{11} = s_y^2 \left( \frac{S_x^2 C_x + M_d}{S_y^2 C_x + M_d} \right)\]  

(20) \]

\[\text{Bias}\left(t_{11}\right) = \frac{1-f}{n} S_y^2 A_{11} \left[ A_{11} \left( \lambda_{04} - 1 \right) - \left( \lambda_{22} - 1 \right) \right] \]

(21) \]

\[\text{MSE}\left(t_{11}\right) = \frac{1-f}{n} S_y^4 \left[ \left( \lambda_{40} - 1 \right) + A_{11}^2 \left( \lambda_{04} - 1 \right) - 2 A_{11} \left( \lambda_{22} - 1 \right) \right] \]

(22) \]

Where \( A_{11} = \frac{S^2}{S^2 + M_d} \)

[11] proposed a class of ratio type variance estimators utilizing different known parameters of auxiliary variable as:

\[t_{12} = s_y^2 \left( \frac{S_x^2 \beta_x + M_d^2}{S_y^2 \beta_x + M_d^2} \right)\]  

(23) \]

\[\text{Bias}\left(t_{12}\right) = \frac{1-f}{n} A_{12} S_y^2 \left[ A_{12} \left( \lambda_{04} - 1 \right) - \left( \lambda_{22} - 1 \right) \right] \]

(24) \]

\[\text{MSE}\left(t_{12}\right) = \frac{1-f}{n} S_y^4 \left[ \left( \beta_{2(y)} - 1 \right) + A_{12}^2 \left( \beta_{2(x)} - 1 \right) - 2 A_{12} \left( \lambda_{22} - 1 \right) \right] \]

(25) \]

Where \( A_{12} = \frac{S^2}{S^2 \beta_x + M_d} \)
In this paper, modified estimator of population variance in simple random sampling has been proposed with objective to produce efficient estimator and its properties have been established.

2. Materials and Method

2.1 Proposed Estimator
Motivated by the work of [11], we proposed a ratio estimator of finite population variance by imposing unknown weight \( k \) and quartile deviation \( (Q_c) \) of auxiliary variable as:

\[
\hat{S}_{MJ}^2 = k s_y^2 \left( \frac{S^2_c Q^2 + M_d}{s_y^2 Q^2 + M_d} \right)
\]  
(26)

Where \( k \) is unknown weight to be determined such that the MSE of the proposed estimator \( \hat{S}_{MJ}^2 \) is minimized.

2.2 Properties of Proposed Estimator
In order to determine the bias and MSE of \( \hat{S}_{MJ}^2 \), we define \( e_0 = \frac{s_y^2 - S_y^2}{S_y^2} \) and \( e_1 = \frac{s_x^2 - S_x^2}{S_x^2} \) such that

\[
s_y^2 = S_y^2 (1 + e_0) \quad \text{and} \quad s_x^2 = S_x^2 (1 + e_1),
\]

from the definition of \( e_0 \) and \( e_1 \), obtaining

\[
E(e_0) = E(e_1) = 0, \quad E(e_0^2) = \frac{1-f}{n} (\beta_{2(y)} - 1)
\]
\[
E(e_1^2) = \frac{1-f}{n} (\beta_{2(x)} - 1), \quad E(e_0 e_1) = \frac{1-f}{n} (\lambda_{22} - 1)
\]  
(27)

Now expressing (26) in error terms as:

\[
\hat{S}_{MJ}^2 = S_y^2 (1 + e_0) k \left\{ \frac{S^2_c Q^2 + M_d}{S^2_y Q^2 (1 + e_1) + M_d} \right\}
\]  
(28)

Simplifying (28) up to first order approximation, it reduces to (28) as:

\[
\hat{S}_{MJ}^2 = S_y^2 \left( k + ke_0 - kte_1 - kte_0 e_1 + kt^2 e_1^2 \right)
\]  
(29)

Where \( t = \frac{S^2_c Q^2}{S^2_y Q^2 + M_d} \)

Subtracting \( S_y^2 \) from both sides of (29)

\[
\hat{S}_{MJ}^2 - S_y^2 = S_y^2 \left( k + ke_0 - kte_1 - kte_0 e_1 + kt^2 e_1^2 \right) - S_y^2
\]  
(30)

Taking Expectation of both sides of (30)

\[
E\left( \hat{S}_{MJ}^2 - S_y^2 \right) = S_y^2 E\left( (k-1) + ke_0 - kte_1 - kte_0 e_1 + kt^2 e_1^2 \right)
\]  
(31)

Applying the results of (27), obtaining the Bias \( \left( \hat{S}_{MJ}^2 \right) \) as:

\[
Bias \left( \hat{S}_{MJ}^2 \right) = S_y^2 \left[ (k-1) + \frac{1-f}{n} kt^2 (\lambda_{04} - 1) - \frac{1-f}{n} kt (\lambda_{22} - 1) \right]
\]  
(32)
Squaring, taking expectation (31) using the results in equation (27), and differentiating partially with respect to \( k \) and equate to zero, we obtain the \( \text{MSE} \left( \hat{S}_{MJ}^2 \right) \) of the proposed estimator as:

\[
\text{MSE} \left( \hat{S}_{MJ}^2 \right) = S_y^2 \left( 1 - \frac{P^2}{Q} \right)
\]

(33)

Where \( k = \frac{1 - f}{n} \left[ t^2 \left( \beta_{2(x)} - 1 \right) - t \left( \lambda_{22} - 1 \right) \right] + 1 \)

\[
= \frac{P}{Q}
\]

(34)

2.3 Efficiency Comparison

In this section efficiency of the proposed estimator is compared with efficiencies of some estimators in the literature.

The \( \hat{S}_{MJ}^2 \) of estimator of the finite population variance is more efficient than sample variance if,

\[
\text{MSE} \left( \hat{S}_{MJ}^2 \right) < \text{Var} \left( t_i \right)
\]

\[
\left( 1 - \frac{P^2}{Q} \right) < \frac{1 - f}{n} \left( \lambda_{40} - 1 \right)
\]

(35)

The \( \hat{S}_{MJ}^2 \) of estimator of the finite population variance is more efficient than \( t_2 \) if,

\[
\text{MSE} \left( \hat{S}_{MJ}^2 \right) < \text{MSE} \left( \hat{S}_R^2 \right)
\]

\[
\left( 1 - \frac{P^2}{Q} \right) < \frac{1 - f}{n} \left[ \left( \lambda_{40} - 1 \right) + \left( \lambda_{40} - 1 \right) - 2 \left( \lambda_{22} - 1 \right) \right]
\]

(36)

The \( \hat{S}_{MJ}^2 \) of estimator of the finite population variance is more efficient than \( t_3 \) if,

\[
\text{MSE} \left( \hat{S}_{MJ}^2 \right) < \text{MSE} \left( t_3 \right)
\]

\[
\left( 1 - \frac{P^2}{Q} \right) < \frac{1 - f}{n} \left[ \left( \lambda_{40} - 1 \right) + A_i^2 \left( \lambda_{40} - 1 \right) - 2 A_i \left( \lambda_{22} - 1 \right) \right]
\]

(37)

The \( \hat{S}_{MJ}^2 \) of estimator of the finite population variance is more efficient than \( t_i \) if,

\[
\text{MSE} \left( \hat{S}_{MJ}^2 \right) < \text{MSE} \left( t_i \right)
\]

\[
i = 4, 5, 6, 7
\]

(38)

The \( \hat{S}_{MJ}^2 \) of estimator of the finite population variance is more efficient than \( t_i \) if,

\[
\text{MSE} \left( \hat{S}_{MJ}^2 \right) < \text{MSE} \left( t_i \right)
\]

\[
i = 8, 9, 10
\]
\[
\left(1 - \frac{p^2}{Q}\right) < \frac{1-f}{n} \left(\lambda_{d_0} - 1\right) + A_2^2 (\lambda_{d_1} - 1) - 2A_1 (\lambda_{d_2} - 1) \quad (39)
\]

The \( \hat{S}_{MJ} \) of estimator of the finite population variance is more efficient than \( t_{11} \) if,

\[
MSE\left( \hat{S}_{MJ} \right)_{\text{min}} < MSE\left( t_{11} \right)
\]

\[
\left(1 - \frac{p^2}{Q}\right) < \frac{1-f}{n} \left(\lambda_{d_0} - 1\right) + A_2^2 (\lambda_{d_1} - 1) - 2A_1 (\lambda_{d_2} - 1) \quad (40)
\]

The \( \hat{S}_{MJ} \) of estimator of the finite population variance is more efficient than \( t_{12} \) if,

\[
MSE\left( \hat{S}_{MJ} \right)_{\text{min}} < MSE\left( t_{12} \right)
\]

\[
\left(1 - \frac{p^2}{Q}\right) < \frac{1-f}{n} \left(\lambda_{d_0} - 1\right) + A_2^2 (\lambda_{d_1} - 1) - 2A_1 (\lambda_{d_2} - 1) \quad (41)
\]

When conditions (35), (36), (37), (38), (39), (40), and (41) are satisfied, we can conclude that the proposed estimator is more efficient than some selected existing estimators.

3. Results and Discussion

3.1 Numerical Illustration

In order to investigate the merits of the proposed estimator of finite population variance over sample variance and some selected existing estimators under simple random sampling without replacement (SRSWOR), we have considered the following real populations.

Table 3 shows the results of Percentage Relative Efficiency (PRE) of the proposed and some existing estimators considered in the study for populations I and II. The results revealed that the proposed estimator has the highest PRE among the estimators considered in the study.

We proposed an estimator of population mean. The performance of the proposed estimator over the usual ratio estimator and some selected existing estimators whereby two real populations were examined. The Bias and Mean Square Error (MSE) of the proposed estimator were derived. Table 2 shows the biases values of the existing and proposed estimators. The results revealed that the proposed estimator has minimum values of MSE in the populations considered in the study. Table 3 shows the results of Percentage Relative Efficiency (PRE) of the proposed and some related estimators considered in the study for populations I and II with difference ranging from 4.92%, 110.93%, and 32.10%, 42.04% respectively.

4. Conclusion

The results of this work have revealed that the proposed estimator, having minimum mean square error (MSE) (i.e. 1957.662 and 71444.085 for populations I and II respectively) and highest percentage relative efficiency (PRE) ranging from 4.92% to 110.93% efficient in population I and 32.10% to 42.04% efficient in population II among the selected existing estimators. With this fact, we conclude that the proposed estimator is proficient than some selected existing estimators and should be used in practical applications in estimating finite population variance.
Nomenclature

N : Population size
n : Sample size
Y : Study variable
X : Auxiliary variable
\bar{Y}, \bar{X} : Sample means of study and auxiliary variables
\bar{Y}, \bar{X} : Population means of study and auxiliary variables
\rho : Coefficient of correlation
C_y, C_x : Coefficient of variations of study and auxiliary variables
Q_3 : The upper quartile
Q_1 : The lower quartile
Q_c : Coefficient of quartile deviation
\beta_{2(y)} : Coefficient of kurtosis of study variable
\beta_{2(x)} : Coefficient of kurtosis of auxiliary variable
M_d : Median of the auxiliary variable

5. Acknowledgement

The authors wish to acknowledge the anonymous reviewers for their valuable and the Editor in Chief for their recommendations.
